

Preparing for a presentation involves a lot of things; making sure the slides are in order, the presentation is cohesive and well-connected, a quick rehearsal, checking and rechecking that you have the presentation file on your laptop, and making sure it is working. Presentations largely still live on our laptops and if you forget your laptop, or don't have one available to access a presentation file from a cloud drive, it's a problem of nightmare proportions. If however you're presenting via a Chromecast device all you need is your smartphone and the Google Slides app to give a presentation.

Google Slides natively supports Chromecast. Android users can more or less just cast their entire screen to a TV with the Chromecast since there is support for the device on the OS level but if you're running an older version of Android, one that doesn't support Chromecast, you aren't without options.

For both Android and iOS users Google Slides bridges the gap easily. Tap the presentation file inside Google Slides and you will see the 'Cast' button appear at the top (if there is a device on the network). Tap it and select the device from those it detects and it will begin casting to your TV.
